Boson / Fermion Material (BFM) – New Matter

We have developed a new process and technology to create a material which can mimic other types of matter, metals and elements without containing the electron structure of these materials.

This new matter has several properties which are necessary for the future, but is not widely known by the population of our civilization.

BFM is a boson / fermion material. It looks like metal, acts like metal, but will not test as any known metal. It can go back and forth on the redox. It can be in a fermion state as metal and a boson state as ions or powder.

Boson / fermion material exists in a visible state and can be moved between the boson and fermion states of matter. BFM does not show up as normal elements with most current testing procedures. It does not exist, although it has the characteristics of a solid state fermion metal.

Fermion state can be changed to the boson state with APM (All-Purpose Medicine) and life form cell structure.

New life forms / clones will be constructed with APM as a base and will be BFM type of structures (a lot of boson and a little fermion). Life forms will be in a quantum state.

Humans and life forms are made up of concentrated energy particles attached to a brane. The energy interacts to form mechanisms in order that communication and thought evolve.

APM are boson state particles. APM rebuilds the body's DNA and cells into a boson state instead of a fermion state.

SCM (Super-Conductive Material) is a boson state material. We can manufacture boson state objects.

Boson / fermion material can and is a combination of both types of particles. BFM can co-exist. Therefore, boson cells can co-exist with fermion cells in the body.

Use New Matter to Mimic other Realities

- This new matter does not exist in this reality with the present testing techniques.
- Use new material to make coins (Reserves for metals bank).
- Use new matter to mimic life forms.

The new matter is boson material with the ability to transform into the electron structure and properties of fermion particle material. – Boson/Fermion material (BFM). BFM goes both directions on the redox.

Potential uses of BFM

Potentially BFM can be used to make objects which we will need to take to our Alternate Universe.

New Advanced Matter

Our new material is monoatomic and has the ability to mimic precious metals. It also has the monoatomic properties. Our new test on the material confirms this fact.
